FOR IMMEDIATE RELEASE

ATTENTION: A just-published book on the nature and origin of homosexuality argues that homosexuals are born that way. However, the author acknowledges that homosexual interests can remit in some individuals and explains this within a biological framework.

THE NATURE OF HOMOSEXUALITY: Vindication for Homosexual Activists and the Religious Right

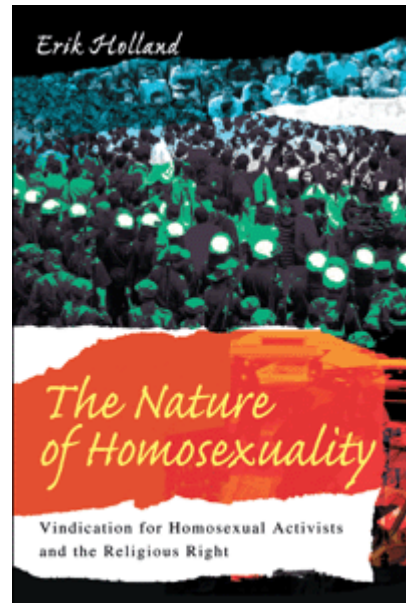

Back Cover Book Description:

Few topics are as fascinating as homosexuality. The origin of homosexuality is perhaps the most interesting aspect of homosexuality. Given the prominence of homosexual issues, it is high time this issue were resolved.

Some biological correlates of homosexuality can be dismissed with little difficulty but others are hard to explain away. Some specific family environments and childhood experiences have been reported as more common among homosexuals than heterosexuals. Homosexual behaviors or interests tend to be unstable in some individuals and this has been interpreted as suggesting that some people chose to be homosexual. Additionally, homosexuality in some contexts was socially tolerated and not extremely uncommon, as in classical Greece, Tokugawa Japan, and some other societies, i.e., homosexuality could be socially constructed. Given diverse potential sources of homosexuality, is a parsimonious explanation of what makes one a homosexual possible?

Yes, it is. Several homosexual activists will be pleased to learn that homosexuals are born that way. However, the religious need not despair; homosexuality is not part of human design. Sounds hard to believe? It gets more interesting. The contents of this book agree with the American Psychiatric Association's decision to stop considering homosexuality as a mental illness in 1973. Intrigued? Look inside...

Science vindicates homosexual activists and the religious right: proof that homosexuals are born that way and that homosexuality is not part of human design.

FOR IMMEDIATE RELEASE

A special note for individuals belonging to religious/ex-gay organizations

Several ex-gays and individuals who belong to religious organizations are well-aware of several correlates of homosexuality that are not readily explicable in terms of the “born that way” paradigm. For instance, homosexual interests tend to be unstable in some individuals, ex-gays being a good example in this regard, and it is not unusual for several self-identified homosexuals to occasionally engage in heterosexual sex, which suggests an element of choice in the acquisition of homosexuality. Additionally, compared to heterosexuals, homosexuals are disproportionately more likely to have experienced childhood molestation and adverse childhood family circumstances. Furthermore, several homosexuals report peer-rejection in childhood. Moreover, when one considers identical twins where one twin is a homosexual, most likely the other twin is a heterosexual.

Correlates of homosexuality such as above are usually not addressed by those who argue that homosexuals are born that way, but these correlates are explained within a biological framework in the book, “The Nature of Homosexuality: Vindication for Homosexual Activists and the Religious Right.” This should not alarm those who believe that homosexuality is a choice or is socially acquired because there is considerable evidence that homosexuality is not part of human design; see the book in this regard.
